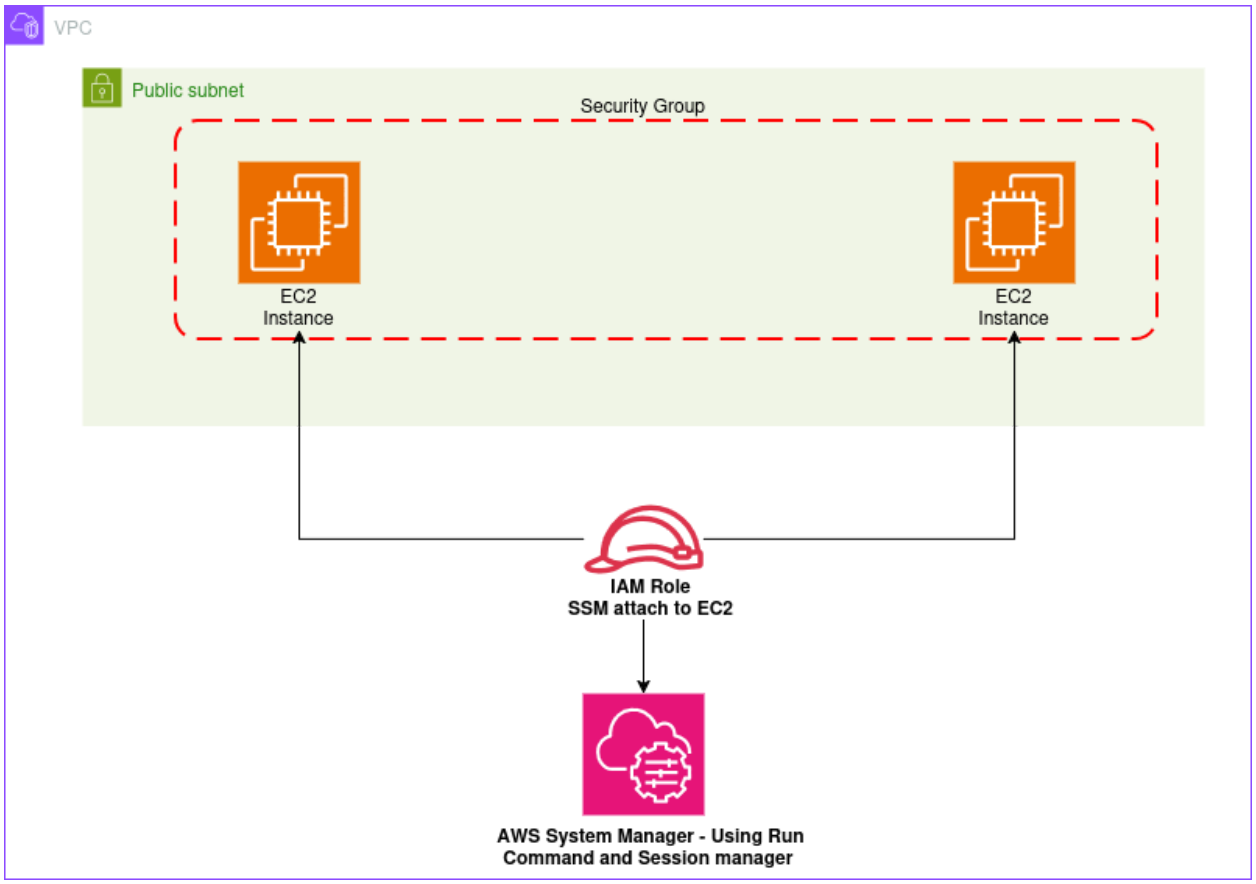
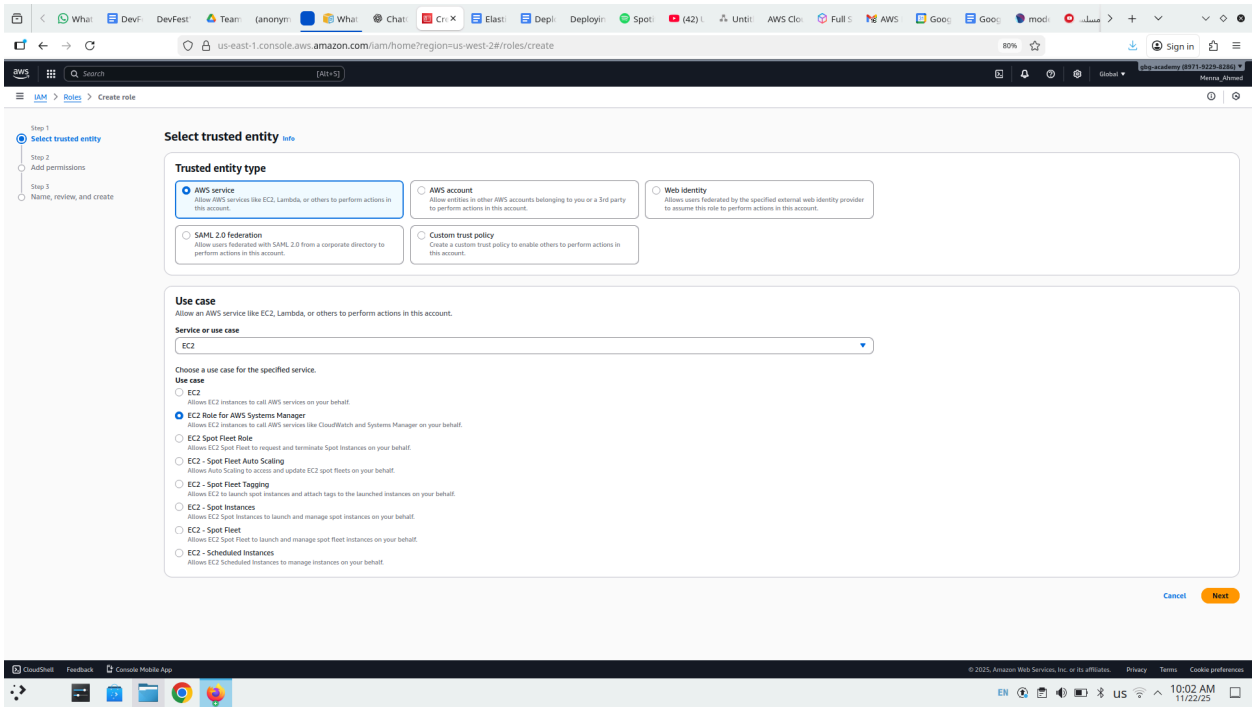
Task-5: Managing EC2 Instances Securely Using AWS Systems Manager

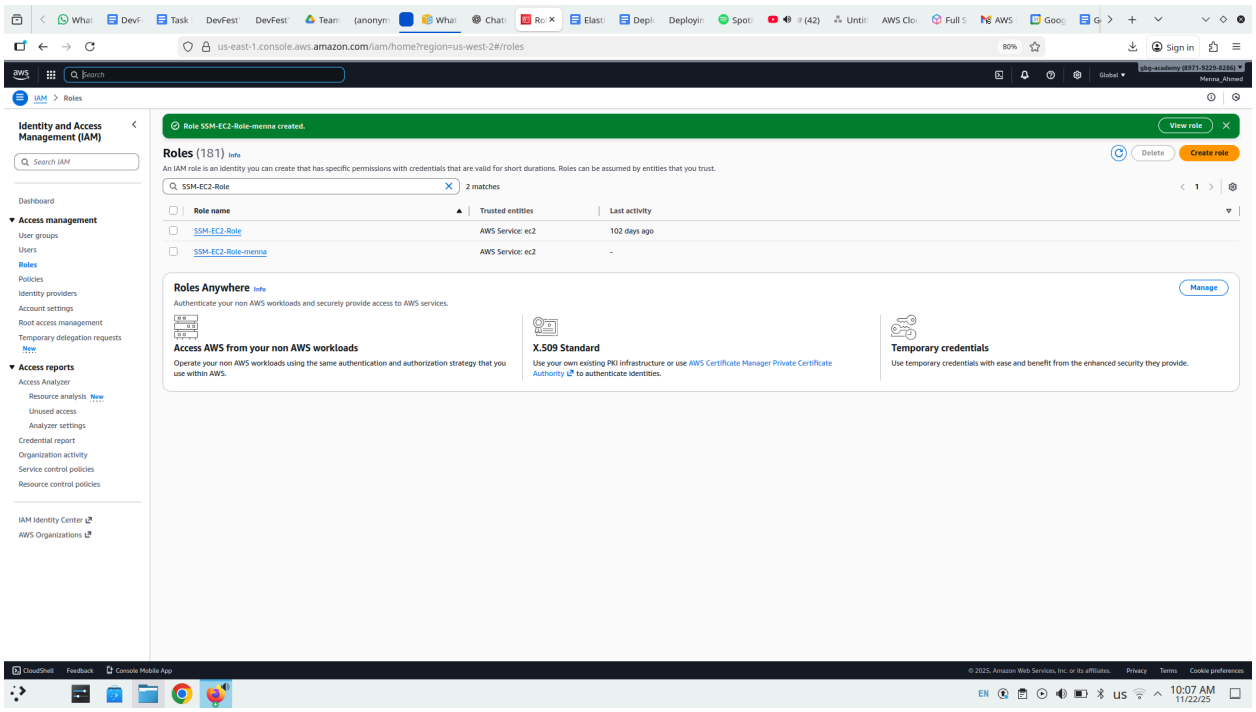
Scenario Description:

An organization wants to improve the way it manages EC2 instances by eliminating the need for SSH access and key pair management. In this task, the team will use AWS Systems Manager to connect to and manage an EC2 instance securely through the AWS Management Console. This includes using Session Manager for remote access and Run Command to install and configure an Apache web server—without using the CLI or opening port 22.

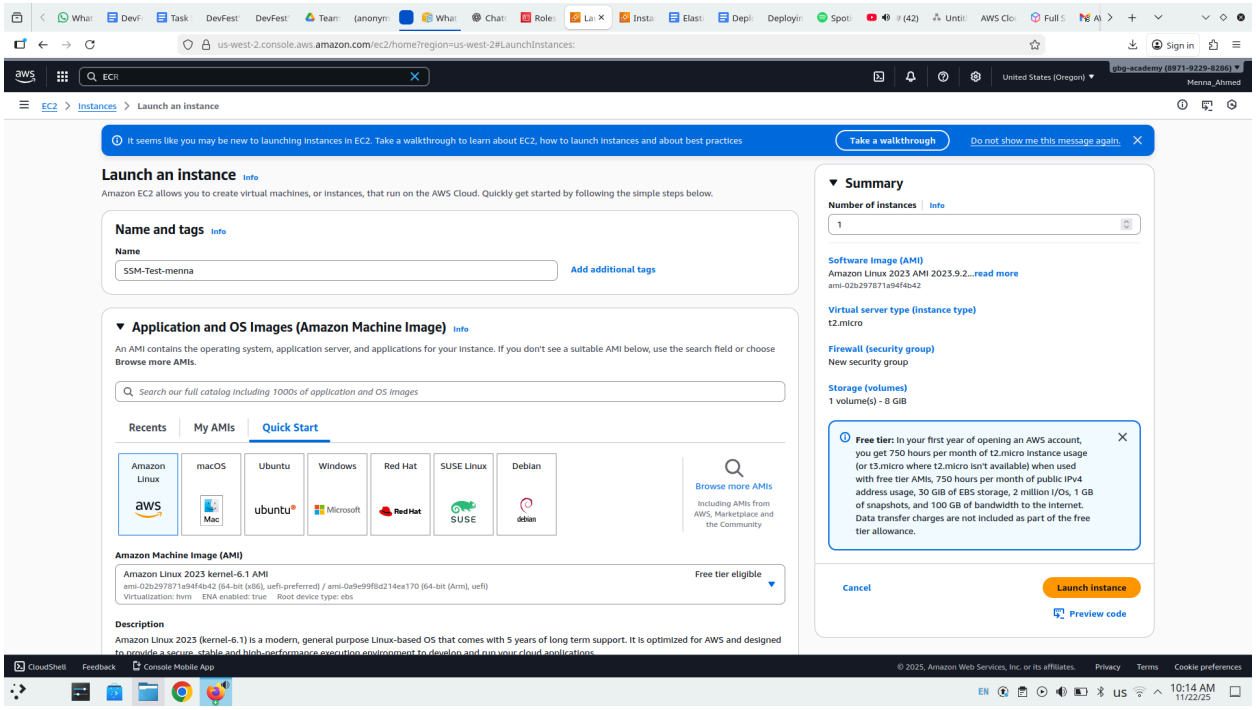


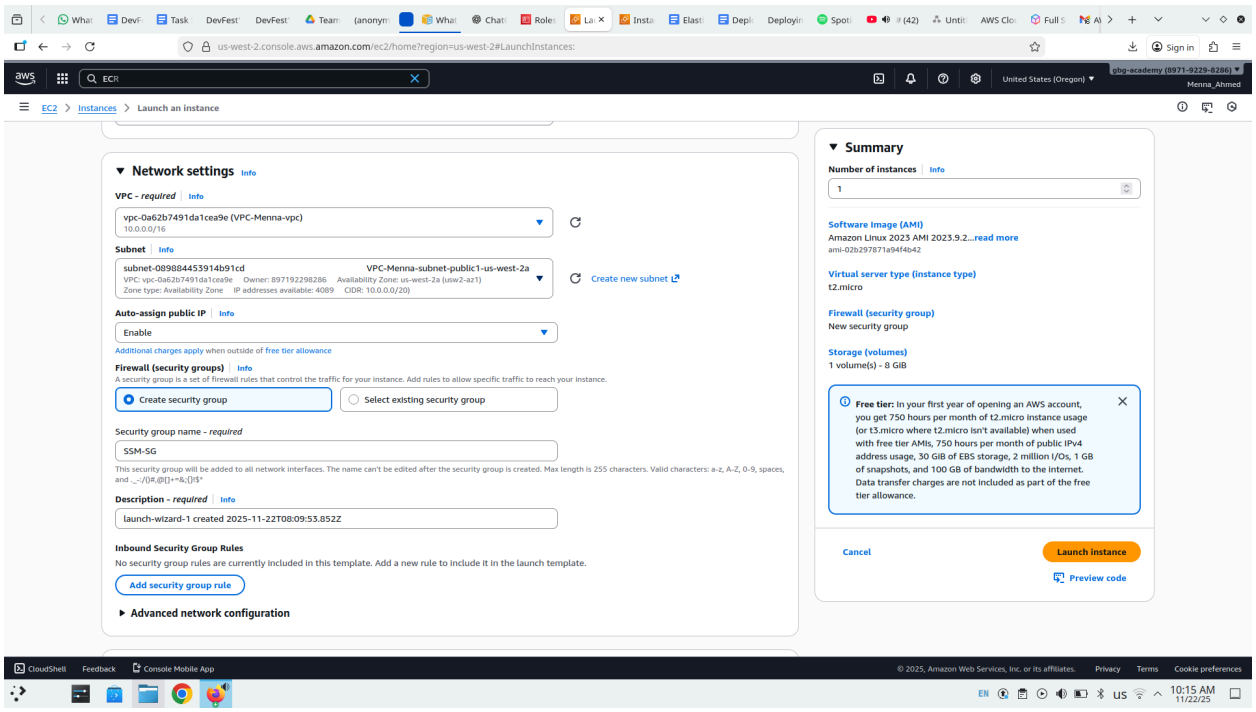
Create IAM Role :
To attach SSM to EC2 instance
Create IAM Role to Attach System Manager to EC2 instance

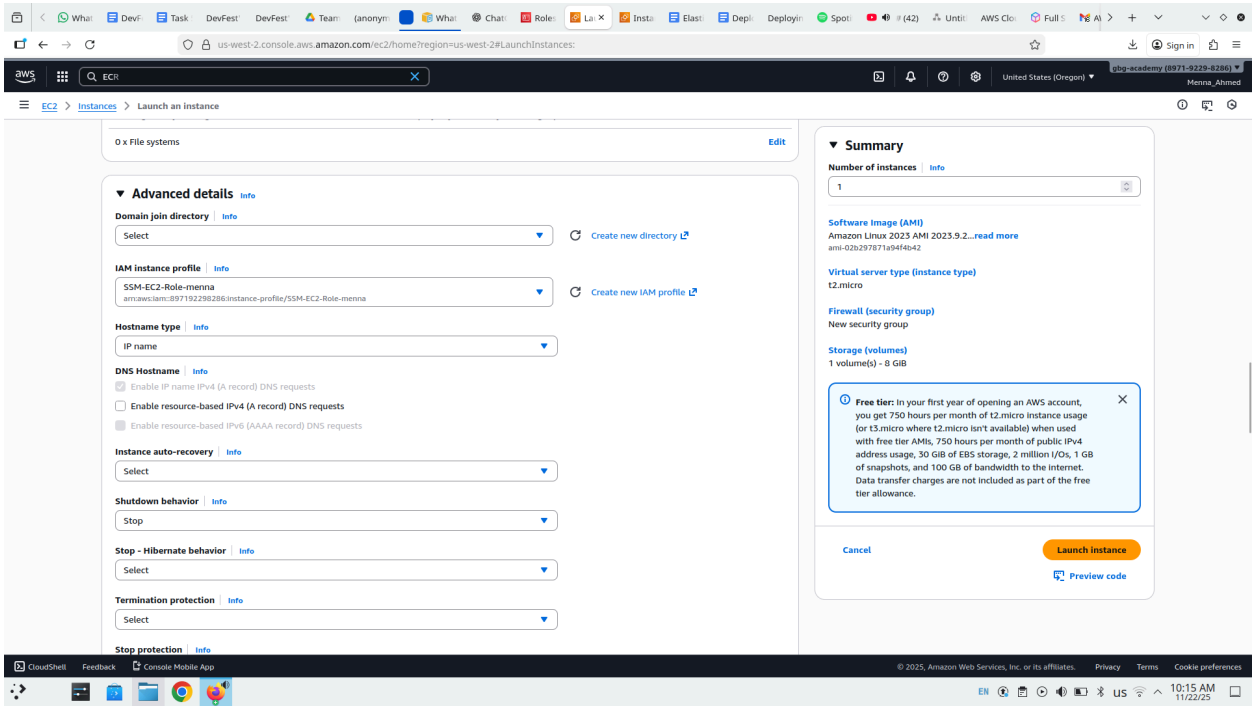




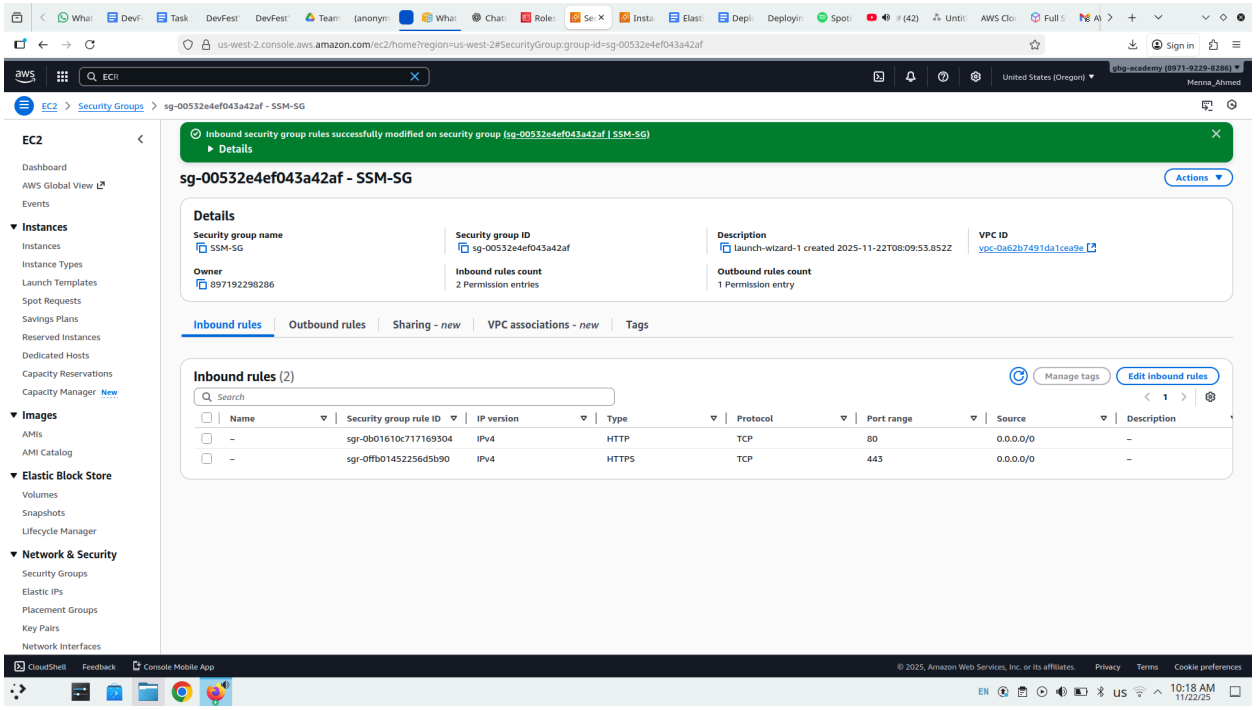
Now Lunch EC2 instance



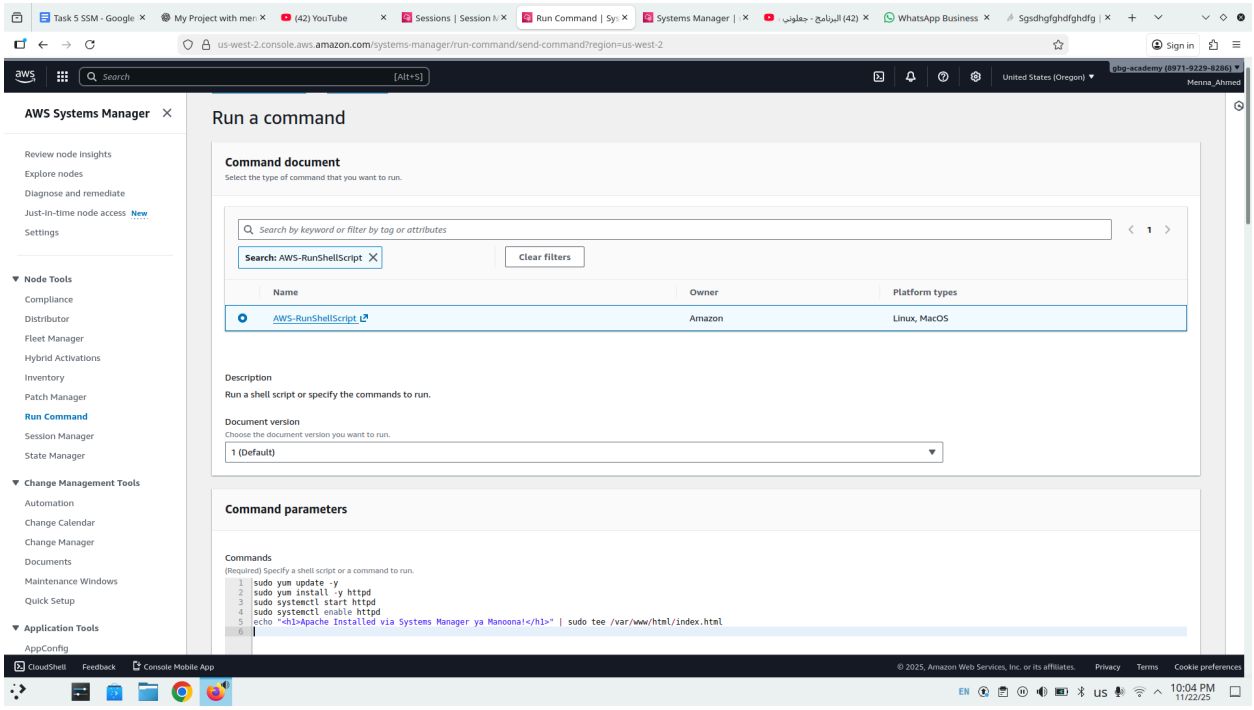




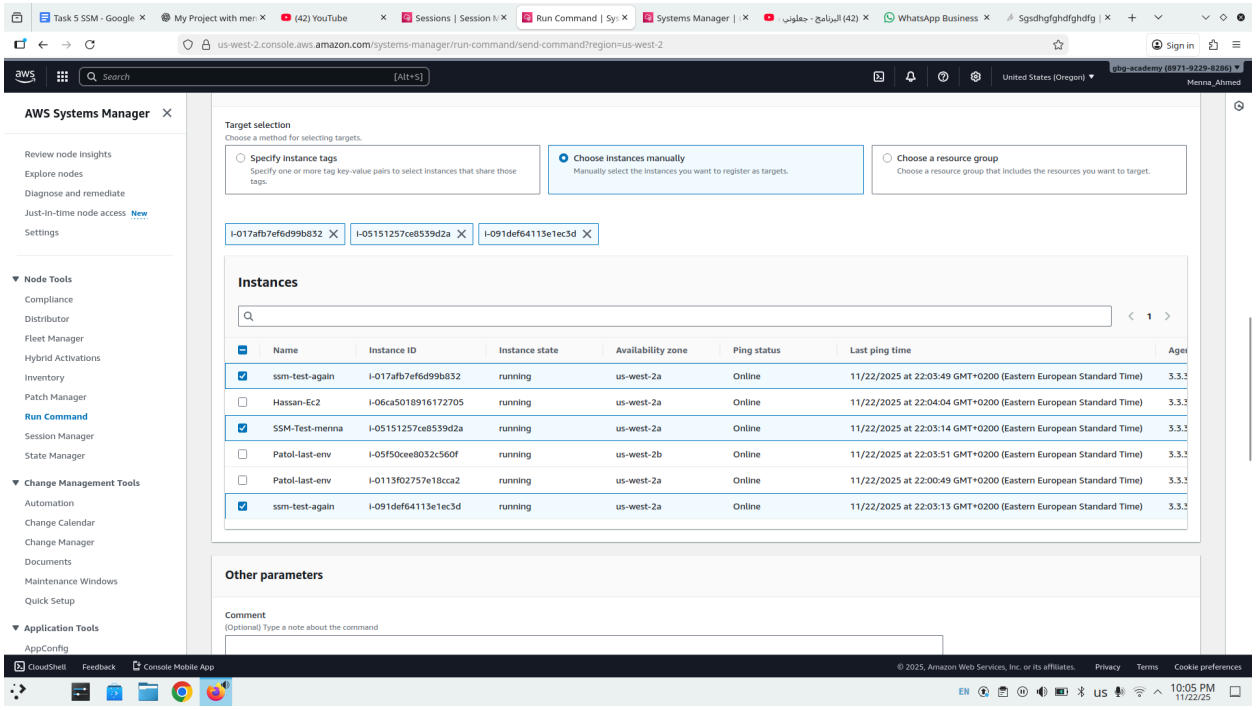
Make sure Security Group have 2 traffic on the inbound



Open Run command and Create and install Apache
Search for AWS-RunShellScript:

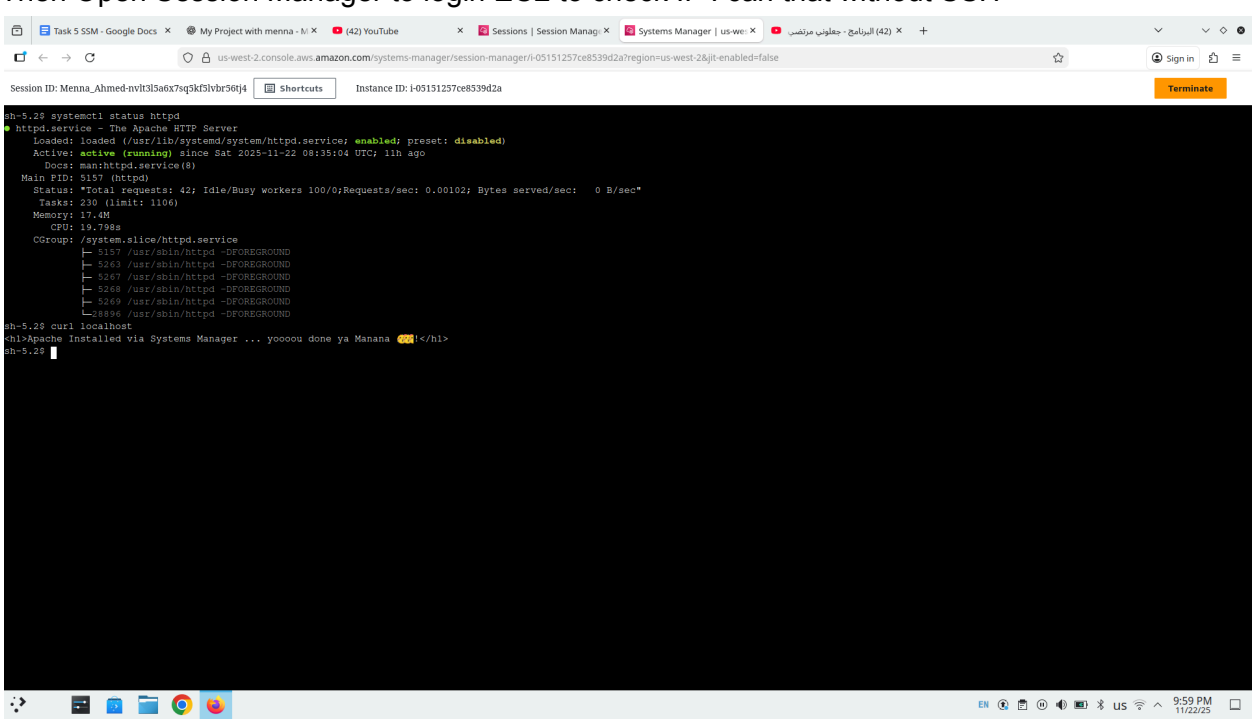


Then Choose Add manually EC2 instance
sudo yum update -y
sudo yum install -y httpd
sudo systemctl start httpd
sudo systemctl enable httpd
echo "<h1>Apache Installed via Systems Manager!</h1>" | sudo tee /var/www/html/index.html



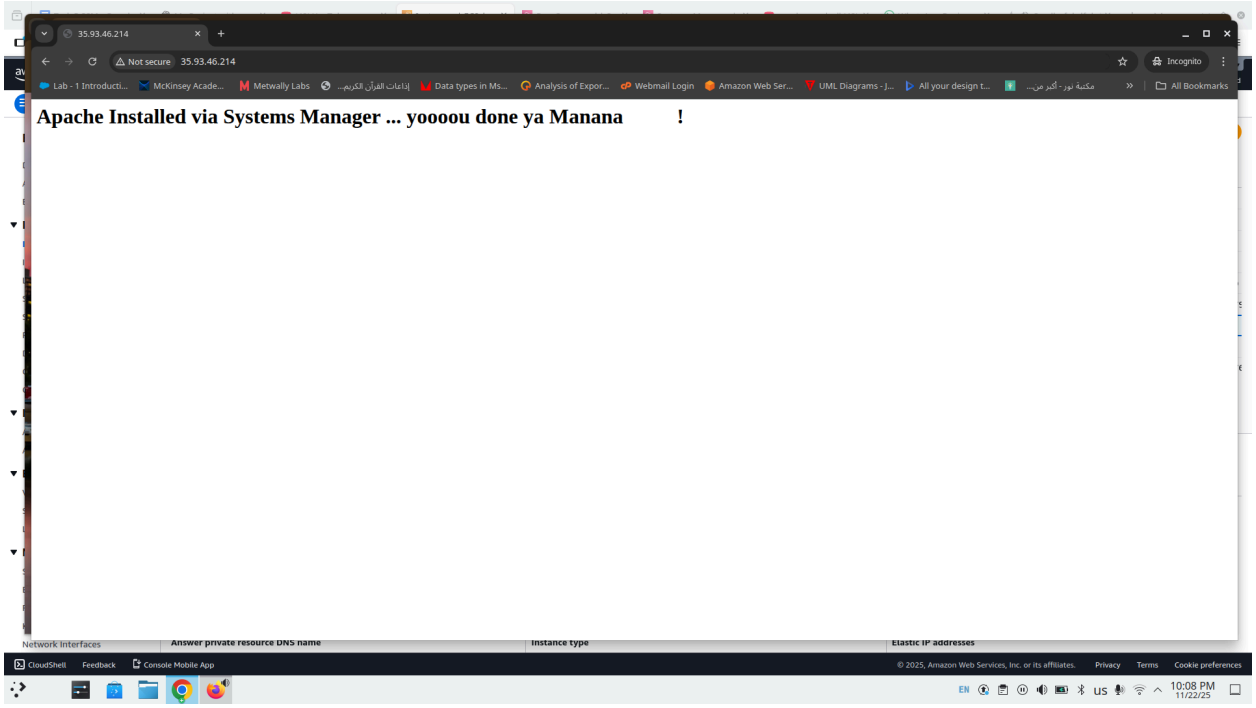
Then Run

Then Open Session Manager to login EC2 to check IF I can that without SSH



I write these command to check :

systemctl status httpd
curl localhost
Then Open EC2 with Public IP Address



Done Elhammdulillah
